

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### *Discussion of Subjects.*

**Chemistry.**—Chemistry, as the science of those changes by which given species of matter become transformed into other species, is the basis of biology and medicine, and forms an essential part of the groundwork of mineralogy, geology and various technical studies, such as assaying, engineering and mining. A knowledge of the elements of chemistry is also essential to a practical education. The work of the first year has been arranged with the view to set the subject in a clear and pleasant light and to give a broad view of its nature and scope rather than a mastery of its infinite details. As chemistry is an experimental science, the student should, at his entrance upon the study, learn to experiment. The work of the Junior class is therefore divided into lectures and laboratory practice, the latter being of such a nature as to illustrate the subjects dealt with in the lectures.

In the second year specialisation begins, those intending to pursue a course in arts, engineering, or mineralogy devoting themselves especially to chemical laws and theories, and to crystallography; while students of medicine take up organic chemistry and the analysis of urine, milk, &c. All students of the second year, however, engage in study of the special chemistry of the metals. In the second year, too, those who are preparing themselves for assaying or mining engineering study systematic qualitative analysis.

In the third year, those who are taking chemistry as part of a liberal education extend their knowledge of organic chemistry and of crystallography, while students intending to take a medical course attend lectures on physiological chemistry. Technical students learn to analyse qualitatively minerals, alloys, &c., and may begin quantitative analysis.

The fourth year is devoted mostly to quantitative analysis and assaying, work which calls for patience, care and industry, and which forms an unsurpassed means of cultivating these qualities. In order to give the Arts student a comprehensive view of the subject, courses of lectures on general chemistry and the history of chemistry are provided. Under the head of general chemistry, the chemical laws and theories are discussed somewhat minutely, and such subjects as the relations of chemical change to heat, light, and electricity are examined.

The well-equipped laboratories of the School of Mining afford every opportunity for the practical work without which the study of an experimental science loses half its value. Experimentation is therefore a feature of the chemical course throughout the four years.

The chemical and assay laboratories are also used for work by post-graduate and other advanced students. Original investigation of chemical and mineralogical problems is carried on. This is a most important, in fact an essential, feature of a progressive scientific school.

*Mechanism.*—Machinery and mechanism play so important a part in modern appliances and modern civilization, that no person can be said to be practically educated who does not know something of the working principles of the more important machines. A machine should be studied along three lines—(1) as to the fundamental mechanical principles and movements which it involves, (2) with reference to its actual construction and to the most appropriate materials entering into it, and (3) as to the mathematical principles of its action, the velocities of the moving portions, the stresses which come upon its several parts, &c.

It is along these three divisions that the study of mechanism and machines will be carried out. The theoretical, but non-mathematical principles of mechanism will be illustrated by means of models and diagrams, and by reference to the action taking place in the various parts of working machines. In order to make this more effective, students will, from time to time, be accompanied to the machine shops of the city, and especially to the works of the Canadian Locomotive and Engine Company, where efficient and complex machines are to be seen in actual work.

For the purpose of making the student more familiar with the construction of machines, he will be required to construct, or assist in constructing, in the workshop, not only models, but working machines, such as lathes, steam engines, dividing plates, gear-cutting engines, &c., and these, although necessarily limited in size, will be complete in form and action. Different machines will be taken up in different sessions.

Besides the foregoing, students will be required to obtain a thorough knowledge of the principles of construction, and of the methods of use of the different scientific instruments commonly employed in the various applications of science, such as scales, slide rules, sectors, pantographs, planimeters, verniers, sextants, transits, &c., and of the means of discovering the errors of such instruments and, where practicable, of correcting them.

*Experimental Physics and Electricity.*—The purpose of this class is to bring to the notice of the student the more important of the physical properties of matter, and of the physical forces of the universe, by means of experimentation. Experiments will be arranged and carried out under the guidance of

a competent instructor, and will have reference to such subjects as gravitation, equilibrium, motion on inclined planes, by suspended cords, &c., impact, friction, flotation, &c. Also, a series of experiments will be performed in order to study the properties of heat, under the subjects of dilatation, liquefaction, gasification, thermometry, specific and latent heats—the properties of light under the subjects of refraction, reflection, polarization, &c.—and a special series of experiments will be conducted for the study of electricity in all its variations of thermo-electricity, voltaic-electricity, magneto-electricity, and magnetism, and illustrations will be given by means of various models and small machines, of the application of this wonderful form of energy to telegraphy, telephony, electric lighting, and the driving of machinery.

*Civil Engineering.*—This phrase is so wide in its import that no complete definition of its meaning can be given. It involves the general application of scientific principles to all kinds of material constructions, such as bridges, canals and roads, and an extensive and practical knowledge of the subject can be obtained only by actual experience in carrying out large and varied engineering operations. But the mathematical knowledge and the scientific theory which form the foundation of all engineering work are most readily and conveniently obtained in mathematical classes and in science laboratories. Hence, the subject of Civil Engineering will be taught mostly in theory, illustrated and enforced by diagrams and models of great and notable structures built by eminent engineers, some of whom will give short courses of lectures.

The theoretical part of the subject will include, in addition to the purely mathematical and physical requirements, such matters as mechanism, surveying, strength of materials, structural geology, drawing, &c., &c. Students will be accompanied from time to time, to any engineering operations which may be under way within reasonable distances.

*Surveying.*—This subject will be taught both theoretically and practically. The theoretical part will include such matters as geodesy, plain and spherical trigonometry with the uses and applications of tables and of the ephemeris, theory of surveying instruments with their errors and corrections, principle of least squares, &c. For practice the students will be required to make and work out observations for the meridian, for time, for longitude and for latitude, and to carry on and plot small surveys on both level and unlevel ground.

The sextant, the theodolite and the transit will principally be employed in practical work, and lessons will be given as required in the astronomical observatory.

*Mining Engineering, Architecture and Navigation.*—For these subjects see the calendar of the School of Mining, to be obtained from W. Mason, Bursar.

*Animal Biology.*—This department includes in its widest sense, the anatomy, histology, classification, distribution, embryology, physiology and sociology of animals. To the average medical man the classification, the distribution and the psychology of animals are of much less importance than the other divisions of the subject. It may be well therefore to indicate to intending students the scope and objects of a course which aims at laying a broad foundation for the scientific study of medicine. This can best be done by giving a relatively wide view of the whole subject.

The foundation for the class is laid in the students' first year's work in physics and chemistry, without some knowledge of which it is impossible to understand the physiology of plant and animal life. As the study of form should precede or accompany the study of function, the comparative anatomy of important types of animals will be studied first. Then will follow a course of lectures and demonstrations in animal physiology, prominence being given to the physiology of vertebrates, and especially of mammals, because it is to these we must look, in the future as we have done in the past, for the chief source of our knowledge of so-called human physiology.

Recent progress in physiology being largely due to the use of the microscope, students will be made thoroughly acquainted with modern methods of microscopical research. Histology and Embryology will be studied for two sessions, the demonstrations being given *pari passu* with the lectures in physiology, and forming a bona-fide part of the work of the physiology class.

The study of bacteria will receive the attention which its importance merits.

The foregoing course is a good foundation for acquiring a knowledge of *materia medica*, pathology, and the other special subjects which constitute the strictly professional part of a medical curriculum. For, as the dose of a new medicine and its physiological action on the human body are first determined by experiment upon the lower animals, a knowledge of physiology must precede that of *materia medica*. Pathology is still more dependent upon physiology. It is, in fact, a part of physiology, as being the "natural history" of disease; and the diseased condition of animal or plant can be recognized, and its cause ascertained, only by first being acquainted with the healthy condition.

A student of medicine, therefore, who would be more than a mere tradesman, must acquire a wide knowledge of comparative

anatomy, of comparative physiology, and of the histology of both healthy and diseased tissues. For disease is as "natural" as health, and the study of a diseased animal or plant, whether the disease be due to inheritance, to environment, to over-exertion, or to micro-organisms, is as purely scientific as the study of the same animal or plant in a state of health.

From the preceding outline the student of medicine will perceive that disease is as widespread and as natural as life; that some diseases of animals and plants may be averted by a full knowledge of the life history of the organisms which cause the disease; that disease is often only a special phase in the struggle for existence—a struggle which occurs not so much between individuals of the same species as between widely different species; and that what we term disease in one animal or plant may be caused by a superabundance of health in another animal or plant which, living its own life, preys upon the other, as it struggles to maintain its place in the universe.

For the character and scope of the purely academic subjects forming a part of the Practical Science courses such as mathematics and physics see under Faculty of Arts; and for matters pertaining to theoretical geology, petrography, mineralogy, and assaying, forming parts of the course of mining engineering, see the calendar of the School of Mining.

## *UNIVERSITY COUNCIL.*

---

The Council consists of the Chancellor, the Trustees, the Members of the Senate, and an equal number of elective members.

The Chancellor is elected by the Council, except when two or more candidates are nominated, in which case the election is by registered graduates and alumni. He holds office for three years, and, as highest officer of the University, presides at meetings of Council and Convocation, and at statutory meetings of Senate. In his absence he is represented by the Vice-Chancellor.

Of the elective members eight retire annually, except in every sixth year when ten retire. Successors are elected by registered graduates and alumni. Retiring members may be re-elected.

The Council has power to elect five trustees, one trustee retiring annually, to discuss all questions relating to the College and its welfare, to make representations of its views to the Senate or the Board of Trustees, to decide on proposals for affiliation and to arrange all matters pertaining to the installation of the Chancellor, its own meetings and business, the meetings and proceedings of Convocation, and the fees for membership, registration and voting.

Convocation for the conferring of degrees, etc., is held upon the last Wednesday of April.

N.B.—The Registrar has readjusted the order of retiring of the elective members by the authority of the Council and to comply with the statute. In 1897 ten members will be elected by the vote of the graduates to equalize the representation.
